

# WHAT SECURITY LEADERS GET FROM APImetrics

## 1 Continuous Assurance

Run real-time security checks against your production servers using the same security as users, from the clouds & locations they're in.

## 2 Negative Scenario Testing

Directly test for security scenarios that should never work as well as the ones that must always work.

## 3 OAuth Ready

Go outside your API spec and test OAuth calls, token refreshes, scopes and more with a secure platform that works the way you do.

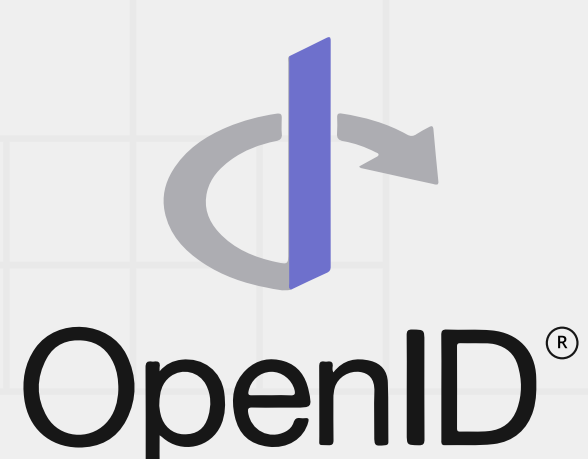

## 4 Full Audit Trails

Log every call and every monitor, produce detailed reports of the calls made and their results for continuous assurance of security like FAPI.

## Functional. Low-code. Secure.

APImetrics functional API-native validation makes it fast and easy to set up and verify API security functions at scale, from where your customers and third parties actually are, and alert, in real-time, to changes and potential vulnerabilities.

## Standards Focused

APImetrics works with the key standards in API security to provide continuous operational assurance that APIs are behaving as designed, in production, from the same geographical locations as your customers and users.
